

Session 11:

- 1.) Open Power BI Desktop and import a CSV file containing monthly step count data (columns: Month, Steps) for a year, then create a Line Chart visual to show the trend of steps over the months.

ANSWERS:

A line chart is created in Power BI to represent the monthly step count data. The Month field is placed on the X-axis, and Steps is used as the value on the Y-axis. This setup helps to clearly display how the number of steps changes over time.

The line chart shows a continuous flow of data, making it easy to observe trends, such as increases or decreases in activity across different months. It provides a clear visual understanding of patterns in the data, helping in better analysis of monthly performance.

Sum of Amount by Month

2.) Using a sample dataset of your favorite food delivery app orders (columns: Restaurant, OrderCount), create a Pie Chart in Power BI to display the share of orders for each restaurant, and customize the legend to show percentage values.

ANSWERS:

A pie chart is created in Power BI to represent the distribution of order counts among different restaurants. The **Restaurant** field is used as the category, and **OrderCount** is used as the value. This helps to show how the total orders are divided across various restaurants.

Each slice of the pie chart represents a restaurant, and the size of each slice indicates its share of total orders. Percentage labels are added to make the comparison more clear and easy to understand.

The pie chart provides a simple and effective way to visualize the contribution of each restaurant, helping to identify which restaurant has the highest and lowest number of orders.

Sum of OrderCount by Restaurant

- 3.) Import a dataset with daily active user counts for three different social media apps (columns: Date, Instagram, WhatsApp, YouTube), and create an Area Chart in Power BI to visualize the usage patterns of all three apps over a two-week period.

ANSWERS:

An **area chart** is created in Power BI to display the comparison of user count across different applications.

The **AppName** field is placed on the X-axis, and **User Count** is used on the Y-axis. The shaded region below the line represents the volume of users for each app, giving a clear visual impact of differences.

This chart makes it easy to compare which application has higher or lower users. It also highlights the overall pattern, showing that **WhatsApp has the highest users**, followed by **YouTube**, while **Instagram has the lowest** in this dataset.

- 4.) Build a Combo Chart in Power BI using a dataset of monthly Zomato orders (columns: Month, TotalOrders, AverageOrderValue), where TotalOrders is shown as columns and AverageOrderValue as a line on the same chart.

Hint: Use the Combo Chart visual and assign the appropriate fields to column and line values.

ANSWERS:

A **combo chart (column + line chart)** is created in Power BI to display both total orders and average order value over the months.

The **Month** field is placed on the X-axis. The **TotalOrders** is shown using column bars on the primary Y-axis, while the **AverageOrderValue** is represented by a line on the secondary Y-axis.

This visualization helps to compare two different measures at the same time. The bars show how the total number of orders changes month by month, and the line shows how the average order value varies.

It makes it easy to understand the relationship between order volume and value, and to identify trends or patterns across different months.

Sum of TotalOrders and Sum of AverageOrderValue by Month
